

SPBANKLENS 360

Enterprise Banking Operations & Risk Intelligence Platform

EXECUTIVE SUMMARY

What It Is

SPBANKLENS 360 is a read-only, enterprise-grade Risk Intelligence and Operational Monitoring platform that unifies fragmented banking operations data into a single operational layer. It does not replace the Core Banking System (CBS) or Loan Origination System (LOS); it aggregates signals from them to give every role a calibrated, real-time view of risk, tasks, and exceptions.

The Problem

Bank branches operate critical risk decisions on incomplete, personally-held information. Operational data is scattered across CBS, LOS, Excel trackers, legal registers, inspection files, and officer memory. The result: missed reviews, delayed recovery, repeated audit observations, weak handovers during transfers, and limited early warning on deteriorating accounts.

What Is Delivered (v1.0 Prototype)

- Role-based dashboards for Branch, Regional Office, Central Office, and Security Admin
- Account 360° — CRM-style deep-dive into any borrower with risk dials and early-warning panels
- Knowledge Notebook 2.0 — structured operational memory with version history and global search
- Officer Continuity Module — digital handover for staff transfers
- Rule-Based Risk Engine with 13 weighted rules and explainable scoring
- Early Warning System (EWS) with automatic task generation and SLA tracking
- Workflow Centre — queues, reminders, email automation, escalation matrix
- NPA Lifecycle, Legal Register, CGTMSE, Inspection & Audit, and Executive War Room
- Data Integration Hub — Excel/CSV upload with validation and mapping
- Branded MIS exports, audit trail, and prototype-ready security with server-side sessions

Business Benefits

Benefit	Outcome
Faster decision-making	Single-screen view replaces multiple Excel trackers and logins
Reduced SLA breaches	Automated reminders, task queues, and escalation timers
Preserved institutional memory	Knowledge Notebook captures visits, conversations, and context
Stronger recovery	Structured NPA/legal timelines with action history and OTS tracking
Consistent reporting	Branded, role-filtered exports for daily/weekly/monthly MIS

Future Roadmap

Production rollout would add live API integration with source systems, enterprise SSO (LDAP/AD/SAML/Okta), AI-assisted risk insights, automated customer communications, multi-bank multi-tenant SaaS deployment, and electronic workflow approvals with sign-offs.
